TO USE

OPTIMAL
IMMUNITY

Significant hormonal and digestive system changes are involved in producing milk. These changes put a cow under additional pressure, increasing the need for key nutrients such as calcium, magnesium and phosphorous, in order to help meet the demands of a high producing dairy cow.

AGVANCE MILKER PREMIX

- Once the cow begins to lactate, the focus must change to supplying a strongly positive DCAD diet.
- A diet high in DCAD has been shown to assist good rumen function and therefore drive production.
- Agvance Lactation Premix delivers a comprehensive mineral formulation, high in calcium, magnesium & phosphorous, to support the cow throughout lactation. This is especially important when cows are feeding on a supplementary feed such as maize.

TECHNICAL INFORMATION

Daily Dose Rate

Agvance Milker Premix can be fed at 250g/cow.
